

Coding & Solution

Date	04 July 2026
Team ID	
Project Name	Smart Lender- AI Based Loan Eligibility Prediction System
Maximum Marks	5 Marks

Coding & Solution

This section evaluates the quality and completeness of your implemented code and the overall solution. Your submission should demonstrate working functionality, clean code practices, and alignment with your defined requirements.

Instructions:

1. Ensure your code is well-structured, commented, and follows best practices for your chosen technology stack.
2. The solution should address the core problem statement and implement the key functional requirements.
3. Include all source files, configuration files, and setup instructions needed to run the application.
4. Attach or link to your code repository (e.g., GitHub) in the table below. **Solution Summary**

Field	Details
Repository Link / URL	[Paste your GitHub / GitLab or hosted link here]
Programming Language(s)	Python, HTML, CSS, JavaScript
Framework(s) Used	Flask, Scikit-learn, Pandas, NumPy
Key Features Implemented	User Registration & Login, Loan Application Form, Data Preprocessing, Loan Eligibility Prediction using Machine Learning, Instant Prediction Results, User Dashboard, Loan History, Report Generation

Setup/ run instructions	Install python and required libraries, run pip install -r requirements.txt, then execute python app.py , and open http://127.0.0.1:5000 in a web browser
--------------------------------	--

Code Quality Checklist

S.N o	Criteria	Status (Yes / No)
1	Code is modular and organized into functions / classes	Yes
2	Meaningful variable and function names are used	Yes
3	Code includes comments / documentation where necessary	Yes
4	Error handling is implemented for critical operations	Yes
5	The application runs without critical errors	Yes
6	Code is committed to a version control repository	Yes (if use git hub)/ No (if not uploaded)

Additional Notes / Comments:

- ☐ The project uses a **Machine Learning model** to predict **loan eligibility** based on applicant information.
- ☐ Data preprocessing (handling missing values, encoding categorical features, and scaling where required) is performed before prediction to improve model accuracy.
- ☐ The application follows a **modular Flask architecture**, making it easy to maintain and extend.
